

Global warming: Prevent poles from melting

A. Such is our dependence on fossil fuels, and such the volume of carbon dioxide we have already released into the atmosphere, that most climate scientists agree that significant global warming is now inevitable – the best we can hope to do is keep it at a reasonable level, and even that going to be an uphill task.

At present, the only serious option on the table for doing this is cutting back on our carbon emissions, but a few countries are making major strides in this regard, the majority are having great difficulty even stemming the rate of increase, let alone reversing. Consequently, an increasing number of scientists are beginning to explore the alternatives. They under the banner of geoengineering generally defined as the intentional large-scale manipulation of the environment.

B. Geoengineering has been shown to work, at least on a small, localised scale, for decades. May Day parades in Moscow have taken place under clear blue skies, aircraft having deposited dry ice, silver iodide (m \$1) and cement powder to disperse clouds. Many of the schemes now suggested look to do the opposite, and reduce the amount of sunlight reaching the planet.

One scheme focuses on achieving a general cooling of the Earth and involves the concept of releasing aerosol sprays into the stratosphere above the Arctic to create clouds of sulphur dioxide, which would, in turn, lead to a global dimming. The idea is modelled on historical volcanic explosions, such as that of Mount Pinatubo in the Philippines in 1991; which led to a short-term cooling of global temperatures by 0.5°C. The aerosols could be delivered by artillery, high-flying aircraft or balloons.

C. Instead of concentrating on global cooling, other schemes look specifically at reversing the melting at the poles. One idea is to bolster an ice cap by spraying it with water. Using pumps to carry water from below the sea ice the spray would come out as snow or ice particles, producing thicker sea ice with a higher albedo (the ratio of sunlight reflected from a surface) to reflect summer radiation. Scientists have also scrutinised whether it is possible to block iceflow in Greenland with cables which have been reinforced, preventing icebergs from moving into the sea.

Veil Albert Kallio, a Finnish scientist, says that such an idea is impractical, because the force of the ice would ultimately snap the cables and rapidly release a large quantity of frozen ice into the sea. However, Kallio believes that the sort of cables used in suspension bridges could potentially be used to divert, rather than halt, the southward movement of ice from Spitsbergen. It would stop the ice moving south, and local currents would see them float northwards' he says.

D. A number of geoengineering ideas are currently being examined in the Russian Arctic. These include planting millions of birch trees: the thinking, according to Kallio, is that their white bark would increase the amount of reflected sunlight. The loss of their leaves in

winter would also enable the snow to reflect radiation. In contrast, the native evergreen pines tend to shade the snow and absorb radiation.

Using ice-breaking vessels to deliberately break up and scatter coastal sea ice in both Arctic and Antarctic waters in their respective autumns, and diverting Russian rivers to increase cold-water flow to ice-forming areas, could also be used to slow down warming, Kallio says. '1 You would need the wind to blow the right way, but in the right conditions, by letting ice float free and head north, you would enhance ice growth.'

E. But will such ideas ever be implemented? The major counter-arguments to geoengineering schemes are, first, that they are a 'cop-out' that allow US to continue living the way we do, rather than reducing carbon emissions; and, second, even if they do work, would the side-effects outweigh the advantages? Then there's the daunting prospect of upkeep and repair of any scheme as well as the consequences of a technical failure. 'I think all of US agree that if we were to end geoengineering on a given day, then the planet would return to its pre-engineered condition very rapidly, and probably within 10 to 20 years' says Dr Phil Rasch, chief scientist for climate change at the US-based Pacific Northwest National Laboratory.

That's certainly something to worry about. I would consider geoengineering as a strategy to employ only we manage the conversion to a non-fossil-fuel economy. 'The risk with geoengineering projects is that you can "overshoot",' says Dr Dan Hunt, from the University of Bristol. 'You may bring global temperatures back to pre-industrial levels, but the risk is that the poles will still be warmer than they should be and the tropics be cooler than before industrialization.'

F. The main reason why geoengineering is countenanced by the mainstream scientific community is that most researchers have little faith in the of politicians to agree – and then bring in the necessary carbon cuts. Even leading conservation organisations believe the subject worth exploring. As Dr Martin Sommerkorn, a climate change advisor says.'

But human-induced climate change has brought humanity to a position where it important not to exclude thinking thoroughly about this topic and its possibilities despite the potential drawbacks. If, over the coming years, the science US about an ever-increased climate sensitivity of the planet and this isn't unrealistic – then we may be best served by not having to start our thinking from scratch.

Questions 14-18

Reading Passage has six paragraphs, A-F

Which paragraph contains the following information?

Write the correct letter, A-F, in boxes **14-18** on your answer sheet You may use any letter more than once.

14..... the existence of geoengineering projects distracting from the real task of changing the way we live

15..... circumstances in which geoengineering has demonstrated success

16..... Frustrating maintenance problems associated with geoengineering projects

17..... support for geoengineering being due to a lack of confidence in governments

18..... more success in fighting climate change in some parts of the world than others

Questions 19-23

Complete the summary below.

Choose **NO MORE THAN TWO WORDS** from the passage for each answer.

Write your answers in boxes **19-23** on your answer sheet.

Geoengineering projects

A range of geoengineering ideas has been put forward, which aim either to prevent the melting of the ice caps or to stop the general rise in global temperatures. One scheme to discourage the melting of ice and snow involves introducing **19**..... to the Arctic because of their colour. The build-up of ice could be encouraged by dispersing ice along the coasts using special ships and changing the direction of some **20**..... but this scheme is dependent on certain weather conditions. Another way of increasing the amount of ice involves using **21**..... to bring water to the surface. A scheme to stop ice moving would apply **22**.....but this method is more likely to be successful in preventing the ice from travelling in one direction rather than stopping it altogether. A suggestion for cooling global temperatures is based on what has happened in the past after **23**..... and it involves creating clouds of gas.

Questions 24-26

Look at the following people (**Questions 24-26**) and the list of opinions below.

Match each person with the correct opinion, A-E.

Write the correct letter, A-E, in boxes **24-26** on your answer sheet.

24..... Phil Rasch

25..... DanLunt

26..... Martin Sommerkorn

List of opinions

- A. The problems of geoengineering shouldn't mean that ideas are not seriously considered.
- B. Some geoengineering projects are more likely to succeed than others,
- C. Geoengineering only offers a short-term relief.
- D. A positive outcome of geoengineering may have a negative consequence elsewhere.
- E. Most geoengineering projects aren't clear in what they are aiming at.

Solution:

- | | |
|-------------------|-------------------------|
| 1. E | 8. pumps |
| 2. B | 9. cables |
| 3. E | 10. volcanic explosions |
| 4. F | 11. C |
| 5. A | 12. D |
| 6. birch trees | 13. A |
| 7. Russian rivers | |
